- Type III: Add a Column (good for one change)

"SLOWLY-CHANGING DIMENSIONS"

- Type I: Overwrite it
- Type II: Add a Row
- Type III: Add a Column (good for one change)

later:

- Type IV: Mini-dimensions
- Type V: Mini-dimensions with outriggers
- Type VI: Original vs Current
- Type VII: Type I + Type II

THE FIRST DBA?

ΑΡΙΣΤΟΤΕΛΟΥΣ ΚΑΤΗΓΟΡΙΑΙ.

ΠΕΡΙ ΟΜΩΝΥΜΩΝ.

ΟΜΩΝΥΜΑ λέγεται, ὧν ὄνομα μόνον κοινόν, ὁ δὲ κατὰ τοὔνομα λόγος τῆς οὐσίας ἕτερος, οἷον ζῷον, ὅ, τε ἄνθρωπος καὶ τὸ γεγραμμένον· τούτων γὰρ ὄνομα μόνον κοινόν, ὁ δὲ κατὰ τοὔνομα λόγος τῆς οὐσίας ἕτερος· ἐὰν γὰρ ἀποδιδῶ τις τί ἐστιν αὐτῶν ἑκατέρῳ, τὸ ζῴῳ εἶναι, ἴδιον ἑκατέρου λόγον ἀποδώσει.

ΠΕΡΙ ΣΥΝΩΝΥΜΩΝ.

Συνώνυμα δὲ λέγεται, ὧν, τό τε ὄνομα κοινόν, καὶ ὁ κατὰ τοὔ

of access paths in the total model for the community of users of a data bank would eventually become excessively large.

1.3. A Relational View of Data

The term *relation* is used here in its accepted mathematical sense. Given sets S_1, S_2, $\cdots$, S_n (not necessarily distinct), R is a relation on these n sets if it is a set of n-tuples each of which has its first element from S_1, its second element from S_2, and so on.[1] We shall refer to S_j as the jth *domain* of R. As defined above, R is said to have *degree* n. Relations of degree 1 are often called *unary*, degree 2 *binary*, degree 3 *ternary*, and degree n *n-ary*.

For expository reasons, we shall frequently make use of an array representation of relations, but it must be remembered that this particular representation is not an essential part of the relational view being expounded. An ar-

[1] More concisely, R is a subset of the Cartesian product $S_1 \times S_2 \times \cdots \times S_n$.

RESEARCH

TEMPORAL IS DISTINCT FROM TIME-SERIES

time-series	temporal
single timestamp	two timestamps
records events	records things, "versions"
IoT sensors, finance	auditing, history
challenge is scale	challenge is complexity
partitioning	ranges, exclusion constraints
TimescaleDB	`periods`, `pg_bitemporal`

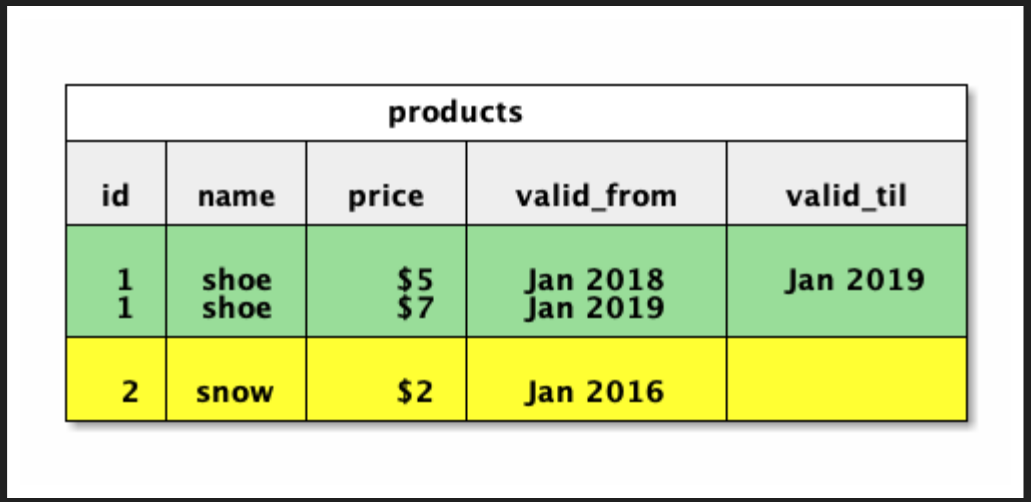
TWO DIMENSIONS

Application Time	System Time
history of the thing	history of the database
application features	auditing, compliance
user can edit	immutable
maintained by you	maintained by Postgres
constraints matter	look Ma, no hands!
`periods`, `pg_bitemporal`	`temporal_tables`, `pg_audit_log`
nothing	Rails: `papertrail`, `audited`, `chronomodel`, ...

TERMINOLOGY

Snodgrass	valid time	transaction time
Fowler	actual time	record time
Date/Darwen/Lorentzos	stated time	logged time
Johnston	effective time/ state time	assertion time
SQL:2011	application time	system time

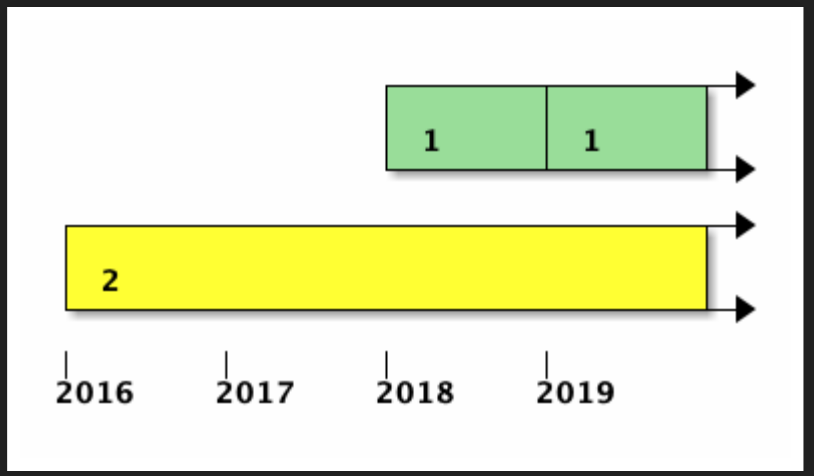
TEMPORAL EXAMPLE



products				
id	name	price	valid_from	valid_til
1	shoe	$5	Jan 2018	Jan 2019
1	shoe	$7	Jan 2019	
2	snow	$2	Jan 2016	

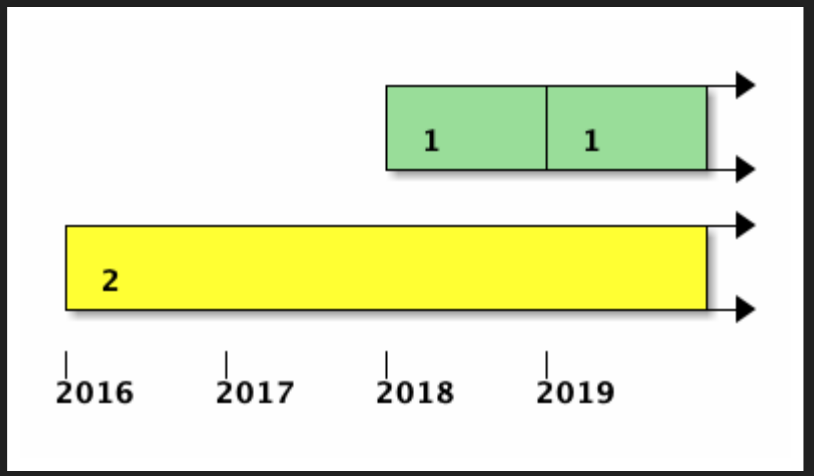
TEMPORAL EXAMPLE

products				
id	name	price	valid_from	valid_til
1	shoe	$5	Jan 2018	Jan 2019
1	shoe	$7	Jan 2019	
2	snow	$2	Jan 2016	



TEMPORAL EXAMPLE

products			
id	name	price	valid_at
1	shoe	$5	[Jan 2018, Jan 2019)
1	shoe	$7	[Jan 2019,)
2	snow	$2	[Jan 2016,)



RANGE OPERATORS

Operator	Description	Example	Result
=	equal	int4range(1,5) = '[1,4]'::int4range	t
<>	not equal	numrange(1.1,2.2) <> numrange(1.1,2.3)	t
<	less than	int4range(1,10) < int4range(2,3)	t
>	greater than	int4range(1,10) > int4range(1,5)	t
<=	less than or equal	numrange(1.1,2.2) <= numrange(1.1,2.2)	t
>=	greater than or equal	numrange(1.1,2.2) >= numrange(1.1,2.0)	t

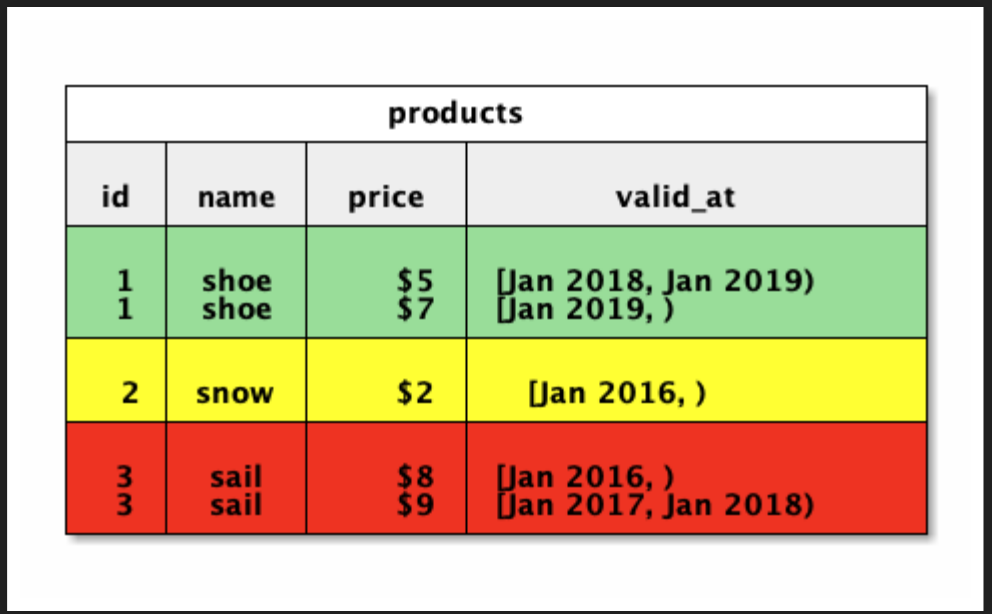
MORE OPERATORS

@>	contains range	int4range(2,4) @> int4range(2,3)	t
@>	contains element	'[2011-01-01,2011-03-01)'::tsrange @> '2011-01-10'::timestamp	t
<@	range is contained by	int4range(2,4) <@ int4range(1,7)	t
<@	element is contained by	42 <@ int4range(1,7)	f
&&	overlap (have points in common)	int8range(3,7) && int8range(4,12)	t
<<	strictly left of	int8range(1,10) << int8range(100,110)	t
>>	strictly right of	int8range(50,60) >> int8range(20,30)	t

AND MORE

&<	does not extend to the right of	int8range(1,20) &< int8range(18,20)	t
&>	does not extend to the left of	int8range(7,20) &> int8range(5,10)	t
-|-	is adjacent to	numrange(1.1,2.2) -|- numrange(2.2,3.3)	t
+	union	numrange(5,15) + numrange(10,20)	[5,20)
*	intersection	int8range(5,15) * int8range(10,20)	[10,15)
-	difference	int8range(5,15) - int8range(10,20)	[5,10)

NON-UNIQUE PKS



products			
id	name	price	valid_at
1	shoe	$5	[Jan 2018, Jan 2019)
1	shoe	$7	[Jan 2019,)
2	snow	$2	[Jan 2016,)
3	sail	$8	[Jan 2016,)
3	sail	$9	[Jan 2017, Jan 2018)

EXCLUSION CONSTRAINTS

```
ALTER TABLE products
ADD CONSTRAINT products_pk
EXCLUDE USING gist
(id WITH =, valid_at WITH &&);
```

TEMPORAL PKS

```
ALTER TABLE products
ADD CONSTRAINT products_pk
PRIMARY KEY (id, valid_at WITHOUT OVERLAPS);
```

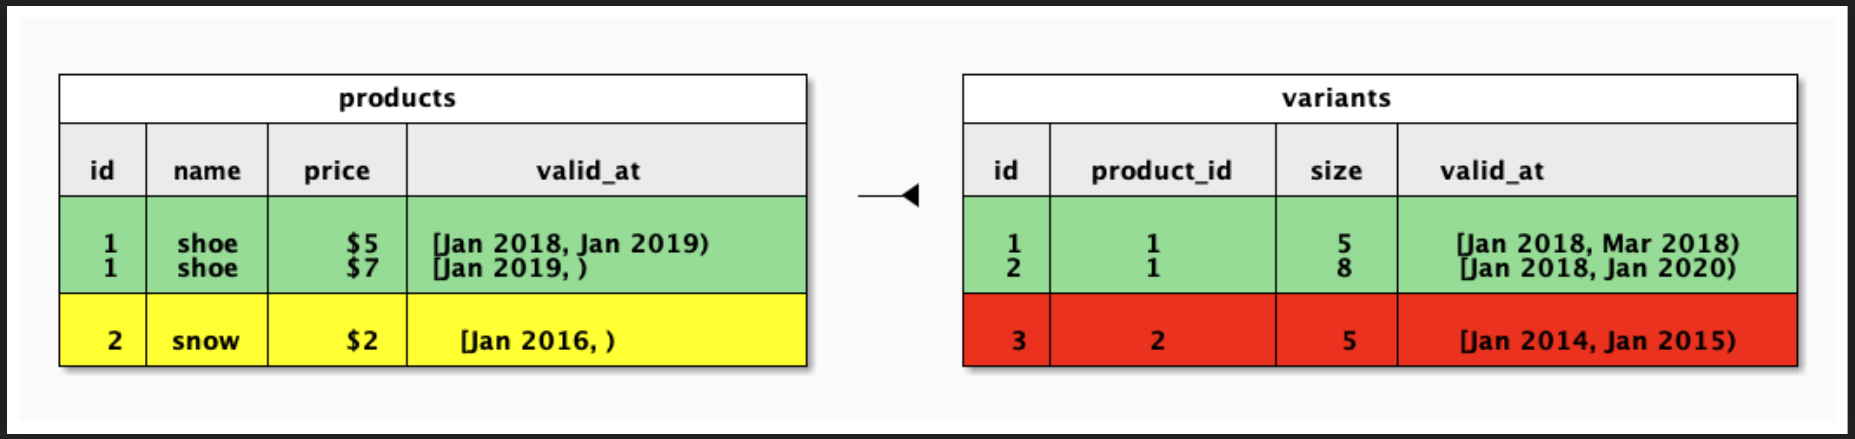
TEMPORAL PKS

```
ALTER TABLE products
ADD CONSTRAINT products_pk
PRIMARY KEY (id, valid_at WITHOUT OVERLAPS);
```

```
ALTER TABLE products
ADD CONSTRAINT products_uq
UNIQUE (id, valid_at WITHOUT OVERLAPS);
```

FOREIGN KEYS

TEMPORAL FOREIGN KEYS



products

id	name	price	valid_at

QUERIES

snapshot ("current")	at a given moment	returns a traditional table (removes `valid_at`)	`WHERE valid_at @> t`
sequenced	across time	returns a temporal table (preserves `valid_at`)	nothing, or `WHERE valid_at && r`
non-sequenced	time is just another column	returns ???
