- questionnaires: changing questions, options
- e-commerce: product price, other attributes
- real estate: house renovations

THE PROBLEM

LOST INFORMATION

- questionnaires: changing questions, options
- e-commerce: product price, other attributes
- real estate: house renovations
- employees: position, salary, employment period

OLAP PROBLEMS TOO

"SLOWLY-CHANGING DIMENSIONS"

- Type I: Overwrite it
- Type II: Add a Row
- Type III: Add a Column (good for one change)

"SLOWLY-CHANGING DIMENSIONS"

- Type I: Overwrite it
- Type II: Add a Row
- Type III: Add a Column (good for one change)

later:

- Type IV: Mini-dimensions
- Type V: Mini-dimensions with outriggers
- Type VI: Original vs Current
- Type VII: Type I + Type II

THE FIRST DBA?

of access paths in the total model for the community of users of a data bank would eventually become excessively large.

1.3. A RELATIONAL VIEW OF DATA

The term *relation* is used here in its accepted mathematical sense. Given sets S_1, S_2, \dots, S_n (not necessarily distinct), R is a relation on these n sets if it is a set of n -tuples each of which has its first element from S_1 , its second element from S_2 , and so on.¹ We shall refer to S_j as the j th *domain* of R . As defined above, R is said to have *degree* n . Relations of degree 1 are often called *unary*, degree 2 *binary*, degree 3 *ternary*, and degree n *n-ary*.

For expository reasons, we shall frequently make use of an array representation of relations, but it must be remembered that this particular representation is not an essential part of the relational view being expounded. An ar-

¹ More concisely, R is a subset of the Cartesian product $S_1 \times S_2 \times \dots \times S_n$.

RESEARCH

RESEARCH

RESEARCH

TEMPORAL IS DISTINCT FROM TIME-SERIES

time-series	temporal
single timestamp	two timestamps
records events	records things, "versions"
IoT sensors, finance	auditing, history
challenge is scale	challenge is complexity
partitioning	ranges, exclusion constraints
TimescaleDB	periods, pg_bitemporal

TWO DIMENSIONS

Application Time	System Time
history of the thing	history of the database
application features	auditing, compliance
user can edit	immutable
maintained by you	maintained by Postgres
constraints matter	look Ma, no hands!
periods, pg_bitemporal	temporal_tables, pg_audit_log
nothing	Rails: papertrail, audited, chronomodel, ...

TERMINOLOGY

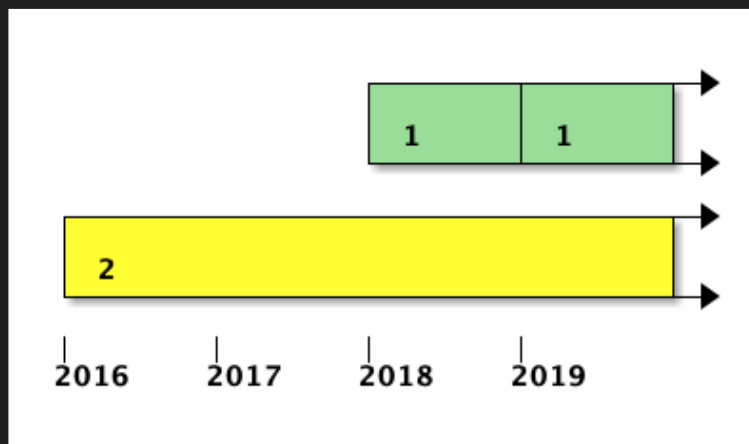

Snodgrass	valid time	transaction time
Fowler	actual time	record time
Date/Darwen/Lorentzos	stated time	logged time
Johnston	effective time/ state time	assertion time
SQL:2011	application time	system time

TEMPORAL EXAMPLE

products				
id	name	price	valid_from	valid_til
1	shoe	\$5	Jan 2018	Jan 2019
1	shoe	\$7	Jan 2019	
2	snow	\$2	Jan 2016	

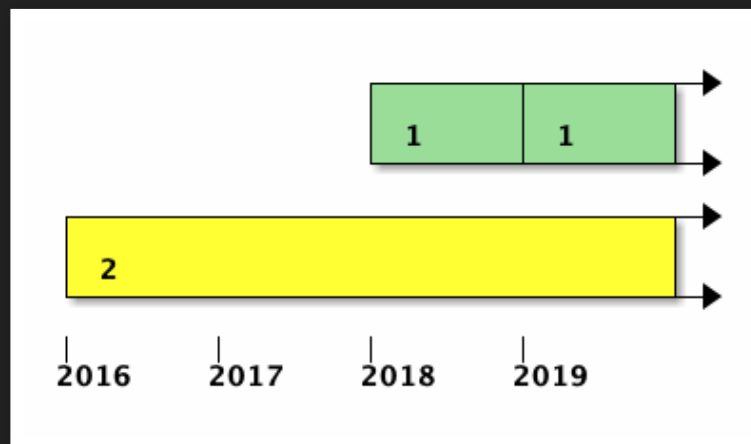

TEMPORAL EXAMPLE

products				
id	name	price	valid_from	valid_til
1	shoe	\$5	Jan 2018	Jan 2019
1	shoe	\$7	Jan 2019	
2	snow	\$2	Jan 2016	

TEMPORAL EXAMPLE

products			
id	name	price	valid_at
1	shoe	\$5	[Jan 2018, Jan 2019) [Jan 2019,)
1	shoe	\$7	
2	snow	\$2	[Jan 2016,)

RANGE OPERATORS

Operator	Description	Example	Result
=	equal	<code>int4range(1,5) = '[1,4]':int4range</code>	t
<>	not equal	<code>numrange(1.1,2.2) <> numrange(1.1,2.3)</code>	t
<	less than	<code>int4range(1,10) < int4range(2,3)</code>	t
>	greater than	<code>int4range(1,10) > int4range(1,5)</code>	t
<=	less than or equal	<code>numrange(1.1,2.2) <= numrange(1.1,2.2)</code>	t
>=	greater than or equal	<code>numrange(1.1,2.2) >= numrange(1.1,2.0)</code>	t

MORE OPERATORS

@>	contains range	int4range(2,4) @> int4range(2,3)	t
@>	contains element	'[2011-01-01,2011-03-01)>::tsrange @> '2011-01-10'::timestamp	t
<@	range is contained by	int4range(2,4) <@ int4range(1,7)	t
<@	element is contained by	42 <@ int4range(1,7)	f
&&	overlap (have points in common)	int8range(3,7) && int8range(4,12)	t
<<	strictly left of	int8range(1,10) << int8range(100,110)	t
>>	strictly right of	int8range(50,60) >> int8range(20,30)	t

AND MORE

&<	does not extend to the right of	<code>int8range(1,20) &< int8range(18,20)</code>	t
&>	does not extend to the left of	<code>int8range(7,20) &> int8range(5,10)</code>	t
- -	is adjacent to	<code>numrange(1.1,2.2) - - numrange(2.2,3.3)</code>	t
+	union	<code>numrange(5,15) + numrange(10,20)</code>	<code>[5,20)</code>
*	intersection	<code>int8range(5,15) * int8range(10,20)</code>	<code>[10,15)</code>
-	difference	<code>int8range(5,15) - int8range(10,20)</code>	<code>[5,10)</code>

NON-UNIQUE PKS

products			
id	name	price	valid_at
1 1	shoe shoe	\$5 \$7	[Jan 2018, Jan 2019) [Jan 2019,)
2	snow	\$2	[Jan 2016,)
3 3	sail sail	\$8 \$9	[Jan 2016,) [Jan 2017, Jan 2018)

EXCLUSION CONSTRAINTS

```
ALTER TABLE products  
ADD CONSTRAINT products_pk  
EXCLUDE USING gist  
(id WITH =, valid_at WITH &&);
```

TEMPORAL PKS

```
ALTER TABLE products  
ADD CONSTRAINT products_pk
